Course Name: Text Processing in the Command Line

Mission Name:- Getting help and Reading Documentation.

* A command's type can be checked using the terminal using "type" command.

* The output to be less verbose, we use "type -t <command>".

* Type of pwd :- builtin

—— mv :- file

—— echo :- builtin

—— while :- keyword

—— zen :- function

—— cd :- builtin

* In Bash, functions can be declared using "declare -F".

* Commands and features that aren't POSIX compliant and are available in Bash are called bashisms.

* compgen is a bashism which completes partial names when we press Tab key.

* Alias can be created using "alias".

Eg:- alias d=date.

* "Unalias" is used to remove the aliasing.

- * "man <command>" is used to open documentation for <command>.
- * "what is <command>" can be used to explore the <command>.
- * We use "man" to access the documentation of programs.
- * We use "help" to access the documentation of built-in commands.
- * "less" can be used to explore files in command line.
- * By default, less will wrap lines that don't fit the screen. We can disable this by using -S option.
